Remote Data Collection

DESCRIPTION

- GP-Pro PBIII and Pro-Server are used to automatically retrieve data from remote water treatment installations using leased line to LAN modems
- Factory Gateway talking to Koyo.
- **Typical setup:** On a preset schedule, flag or trigger the Factory gateway writes to a database on the Pro-Server PC. The attached LAN modem detects a packet bound for the Pro-Server PC and automatically dials to the Pro-Server LAN modem. When modems are connected the database is written to or other actions taken then when activity time out is reached the modems automatically disconnect.
- **Other Setup:** Includes the FGW's sending to Pro-Server, but also the Pro-Server PC can initiate communication to individual sites.
